

For every authorized operating mode, set it in the first section as C1.

- Is it feasible to solve the problem for a horizon S_1 and a sequence = [C1]?
- If so, is it cheaper than the current minimum over the horizon N?

For every authorized operating mode, set it in the second section as C2.

- Is it feasible to solve the problem for a horizon S_2 and a sequence = [C1, C2]?
- If so, is it cheaper than the current minimum over the horizon N?

Explore the next operating mode C1

For every feasible sequence = [C1, C2, C3, C4] over a horizon N, keep only the sequence achieving the lowest cost
